## Slow Exact $k$-NIM SN $(n, k)$

- Play on $n$ stacks of tokens
- Move consists of
- Picking exactly $k$ of the stacks
- Removing one token from each of the selected stacks
- Last person to make a move wins

## Known Results

Gurvich et al. [2020] Slow $k$-Nim.
Chickin et al. [2021] More about Slow Exact $k$-Nim.

- Two infinite families of games: $\operatorname{SN}(n, 1)$ and $\operatorname{SN}(n, n)$ which are deterministic.
- P-positions are
- $\operatorname{SN}(n, 1): \operatorname{sum}(p)$ is even.
- $\operatorname{SN}(n, n): \min (p)$ is even.

P-positions of a non-trivial infinite family, $\operatorname{SN}(n, n-1)$, where play is on all but one stack

## Results for P-Positions of Slow Exact $k$-NIM, $k=n-1$

Characterization of P -positions:

- $s=\operatorname{sum}(\boldsymbol{p}) \bmod d$ where $d=k$ when $n$ is even and $d=2 k$ when $n$ is odd
- $\boldsymbol{o}=\#$ of stacks with odd stack heights

$$
n=10, k=9, s=\operatorname{sum}(\boldsymbol{p}) \bmod 9
$$

$$
n=9, k=8, s=\operatorname{sum}(\boldsymbol{p}) \bmod 16
$$

| s $\backslash 0$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  |  |  |  |  |  |  |  |  |  |  |
| 1 |  |  |  |  |  |  |  |  |  |  |  |
| 2 |  |  |  |  |  |  |  |  |  |  |  |
| 3 |  |  |  |  |  |  |  |  |  |  |  |
| 4 |  |  |  |  |  |  |  |  |  |  |  |
| 5 |  |  |  |  |  |  |  |  |  |  |  |
| 6 |  |  |  |  |  |  |  |  |  |  |  |
| 7 |  |  |  |  |  |  |  |  |  |  |  |
| 8 |  |  |  |  |  |  |  |  |  |  |  |

These results are for REDUCED positions.

## Reduced Positions - Motivation - SN(3,2)

Game trees are isomorphic - same outcome
$\mathbf{p}=(1,1,2)$ is the reduced position for $\mathbf{p}=(1,1,2+m)$ with $m \geq 0$

## Reduced Positions - Definition

Definition: A position is reduced if, for each stack, there exists a sequence of legal moves that deplete the stack.

## Difficult to check, not useful for proofs

## Theorem

A position is reduced if and only if the NIRB (No stack Is Really Big) condition

$$
\max (\boldsymbol{p}) \leq \frac{\operatorname{sum}(\boldsymbol{p})}{k}
$$

is satisfied.

## Outline of Proof of our Results

- Reduce initial position using the NIRB condition repeatedly
- For each position, a move is either to a reduced position or a position that needs to be reduced.
- Characterize when reduction is needed and what reduced position looks like
- Then show that
- from each P-position, all moves lead to $N$-positions
- from each N-position, there is at least one move to a P-position

| s\o | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 |  |  |  |  |  |  |  |  |  |  |  |
| 1 |  |  |  |  |  |  |  |  |  |  |  |
| 2 |  |  |  |  |  |  |  |  |  |  |  |
| 3 |  |  |  |  |  |  |  |  |  |  |  |
| 4 |  |  |  |  |  |  |  |  |  |  |  |
| 5 |  |  |  |  |  |  |  |  |  |  |  |
| 6 |  |  |  |  |  |  |  |  |  |  |  |
| 7 |  |  |  |  |  |  |  |  |  |  |  |
| 8 |  |  |  |  |  |  |  |  |  |  |  |

## Reduction Criterion for even n

$\boldsymbol{p}=\left(p_{1}, p_{2}, \ldots, p_{n}\right)$ with $p_{1} \leq p_{2} \leq \ldots \leq p_{n}$

Lemma: When reduction is needed from a position characterized by ( $s, o$ ) and $\boldsymbol{p}$ has $\alpha \geq 1$ maximal stacks, then the reduced position is given by

$$
r\left(\boldsymbol{p}^{\prime}\right)= \begin{cases}\left(p_{1}-1, p_{2}-1, \ldots, p_{n}-1\right) & \text { if } s>0 \\ \left(p_{1}-1, p_{2}-1, \ldots, p_{n-\alpha}-1, p_{n}-2, \ldots, p_{n}-2\right) & \text { if } s=0\end{cases}
$$

- If $s>0$, then $\left(s^{\prime}, o^{\prime}\right)=(s-1, n-o)$;
- If $s=0$, then $\alpha \leq n-2$ and

$$
s^{\prime}=n-2-\alpha \text { and } o^{\prime}= \begin{cases}n-o-\alpha & \text { if } p_{n} \text { is even } \\ n-o+\alpha & \text { if } p_{n} \text { is odd }\end{cases}
$$

## Illustration for $n$ even - P-Position leads to N-Position

## 3 cases:

$\boldsymbol{s}=\operatorname{sum}(\boldsymbol{p}) \bmod \boldsymbol{k}$

- Move to position that is reduced
- Move to a position that needs reduction; $s>0$ and $s=0$

Case 1: No reduction $\rightarrow$ remove exactly $k$ tokens:

- $s^{\prime}=s \rightarrow$ same row;
- $o^{\prime} \in\{n-o-1, n-o+1\} \begin{aligned} & \text { depending on } \\ & \text { parity of un- }\end{aligned}$ played stack
$\rightarrow$ reflect cell across column $\subset$ and then go either left or right

## Illustration for $n$ even - P-Position leads to N-Position

Case 3: Move is to a position that needs reduction when $s=0$ Take a token from all stacks, and an additional token from the maximal stacks

- $s^{\prime}=n-2-\alpha$ and $o^{\prime}=\left\{\begin{array}{ll}n-o-\alpha & \text { if } p_{n} \text { is even } \\ n-o+\alpha & \text { if } p_{n} \text { is odd }\end{array}\right.$ with $1 \leq \alpha \leq n-2$

## Illustration for $n$ even: N-position to P-position

- No reduction - same row, reflection across midline, then to left or right depending on parity of max
- Yellow and orange squares are the only ones with potential trouble

For orange squares need to check on reduction move, and it turns out this one is available.

## Ongoing and Future Work

Generalization to Slow SetNIM SN $(n, A)$, where the set $A$ indicates the possible numbers of stacks one can play on

Develop a NIRB condition for the game with set $\boldsymbol{A}$

$$
\max (\boldsymbol{p}) \leq \frac{\operatorname{sum}(\boldsymbol{p})}{k}, \quad \text { where } k=\min (\boldsymbol{A})
$$

- Develop characterization when reduction is needed
- depends on the individual game
- Determine what reduced position looks like
- depends on the individual game

Analyze some games

- we have the result for $A=\{n-1, n\}$

## Results for P-Positions of Slow SetNIM SN( $n,\{\boldsymbol{n}-\mathbf{1}, \boldsymbol{n}\})$

$$
n=10, k=9, s=\operatorname{sum}(\boldsymbol{p}) \bmod 9
$$
