

Math 2550-01

4/9/24

---

Test 2 is in two  
weeks. Tuesday 4/23.

Review day is  
Thursday 4/18.

Special example:

The "trivial" vector space is

$$V = \{ \vec{0} \}$$

← the vector space  
with just one  
vector

It turns out that  $V$   
has no basis.

We just define its  
dimension to be 0.

Ex: Let  $V = \mathbb{R}^n$  and  $F = \mathbb{R}$ .

The standard basis for  $\mathbb{R}^n$  is  $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_n$  where  $\vec{v}_i$  has a 1 in spot  $i$  and 0's everywhere else. This gives  $\dim(\mathbb{R}^n) = n$ .

$n$	standard basis for $\mathbb{R}^n$	$\dim(\mathbb{R}^n)$
2	$\vec{v}_1 = \langle 1, 0 \rangle, \vec{v}_2 = \langle 0, 1 \rangle$	2
3	$\vec{v}_1 = \langle 1, 0, 0 \rangle, \vec{v}_2 = \langle 0, 1, 0 \rangle$ $\vec{v}_3 = \langle 0, 0, 1 \rangle$	3
4	$\vec{v}_1 = \langle 1, 0, 0, 0 \rangle$ $\vec{v}_2 = \langle 0, 1, 0, 0 \rangle$	4

$$\vec{v}_3 = \langle 0, 0, 1, 0 \rangle$$

$$\vec{v}_4 = \langle 0, 0, 0, 1 \rangle$$

0  
0  
0

0  
0  
0

0  
0  
0

---

Ex: Let  $n$  be an integer  
with  $n \geq 0$ . Then

$$P_n = \left\{ a_0 + a_1x + a_2x^2 + \dots + a_nx^n \mid \left. \begin{array}{l} a_0, \dots, a_n \\ \text{are in } \mathbb{R} \end{array} \right\} \right\}$$

set of polynomials  
of degree  $\leq n$

The standard basis for  $P_n$  is

$$\vec{v}_0 = 1$$

$$\vec{v}_1 = x$$

$$\vec{v}_2 = x^2$$

...

$$\vec{v}_n = x^n$$

}  $n+1$   
vectors

So,  $\dim(P_n) = n+1$

$n$	standard basis for $P_n$	$\dim(P_n)$
0	1	1
1	1, $x$	2

2	$1, x, x^2$	3
3	$1, x, x^2, x^3$	4
0 0 0	0 0 0	0 0 0

Ex:

$$5 + x - x^3 = 5 \cdot 1 + 1 \cdot x + 0 \cdot x^2 - 1 \cdot x^3$$

Ex: Let  $V = M_{2,2}$

set of  
all  $2 \times 2$   
matrices

$F = \mathbb{R}$ .

Note:

$$\begin{pmatrix} 1 & 2 \\ -1 & 5 \end{pmatrix} = 1 \cdot \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} + 2 \cdot \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} + (-1) \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} + 5 \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$$

One can show [HW 7-Part 1]

that

$$\vec{v}_1 = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, \vec{v}_2 = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix},$$

$$\vec{v}_3 = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}, \vec{v}_4 = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$$

is a basis for  $M_{2,2}$ .

Thus,  $\dim(M_{2,2}) = 4$

Theorem: Let  $V$  be a finite-dimensional vector space over a field  $F$  with  $\dim(V) = n$ .

So,  $V$  has a basis with  $n$  vectors

Let  $\vec{w}_1, \vec{w}_2, \dots, \vec{w}_m$  be vectors from  $V$ .

① If  $m < n$ , then  $\vec{w}_1, \vec{w}_2, \dots, \vec{w}_m$  do not span  $V$ .

② If  $m > n$ , then  $\vec{w}_1, \vec{w}_2, \dots, \vec{w}_m$  are linearly dependent.

Ex: Let  $V = \mathbb{R}^3$ ,  $F = \mathbb{R}$ .

Then,  $\dim(\mathbb{R}^3) = 3$   $\leftarrow$   $n=3$

Let  $\left. \begin{array}{l} \vec{w}_1 = \langle 1, 5, 0 \rangle \\ \vec{w}_2 = \langle 2, -1, 0 \rangle \end{array} \right\} m=2$

① from above says since we only have 2 vectors  $\vec{w}_1, \vec{w}_2$  in a 3-dimensional space, then  $\vec{w}_1, \vec{w}_2$  don't span all of  $\mathbb{R}^3$ . I.e. you can't make all the vectors in  $\mathbb{R}^3$  from just  $\vec{w}_1$  and  $\vec{w}_2$ .

Ex: Let  $V = P_2$ ,  $F = \mathbb{R}$ .

We know that  $\dim(P_2) = 3$   
basis:  $1, x, x^2$

Let

$$\vec{w}_1 = 1 + x$$

$$\vec{w}_2 = 1 - x^2$$

$$\vec{w}_3 = x$$

$$\vec{w}_4 = x^2$$

$m = 4$  vectors  
in a  $n = 3$   
dimensional  
space

② from above says since we have 4 vectors in a 3-dimensional space  $[4 > 3]$  then  $\vec{w}_1, \vec{w}_2, \vec{w}_3, \vec{w}_4$  must be linearly dependent.

Here we have

$$1 \cdot \vec{w}_1 - 1 \cdot \vec{w}_2 - \vec{w}_3 - \vec{w}_4 = \vec{0}$$

$$1+x-1+x^2-x-x^2 = 0$$

$$\vec{w}_1 = \vec{w}_2 + \vec{w}_3 + \vec{w}_4$$

Theorem: Let  $V$  be a finite-dimensional vector space over a field  $F$ .

Let  $n = \dim(V)$

So,  $V$  has a basis with  $n$  vectors in it

Suppose we pick  $n$  vectors

$\vec{w}_1, \vec{w}_2, \dots, \vec{w}_n$  from  $V$ .

① If  $\vec{w}_1, \vec{w}_2, \dots, \vec{w}_n$  are linearly independent, then they will span  $V$  and be a basis for  $V$ .

② If  $\vec{w}_1, \vec{w}_2, \dots, \vec{w}_n$  span  $V$ , then they will be linearly independent and be a basis for  $V$ .

---

Ex:  $V = P_2, F = \mathbb{R}$

We know (since we showed that  $1, x, x^2$  is a basis for  $P_2$ ) that  $\dim(P_2) = 3$ .

Consider

$$\vec{w}_1 = 1$$

$$\vec{w}_2 = 1 + x$$

$$\vec{w}_3 = 1 + x + x^2$$

} 3 vectors

Previously, we showed these vectors are linearly independent. Since we have 3 lin. ind. vectors in a 3-dimensional space, they form a basis for  $P_2$ .
