Topic 6 - Normal subgroups
and Factor groups

Def: Let G be a group and

$H \leq G$. Let $g \in G$.

The left coset of H containing g is

$$gH = \{gh \mid h \in H\}$$

The right coset of H containing g is

$$Hg = \{hg \mid h \in H\}$$

The set of all left cosets is

$$G/H = \{gH \mid g \in G\}$$

I read this
as " $G \bmod H$ "

Ex: $D_6 = \{1, r, r^2, s, sr, sr^2\}$

$H = \langle r \rangle = \{1, r, r^2\}$

$r^3 = 1, s^2 = 1$

left cosets:

$1H = \{1 \cdot 1, 1 \cdot r, 1 \cdot r^2\} = \{1, r, r^2\} = H$

$rH = \{r \cdot 1, r \cdot r, r \cdot r^2\} = \{r, r^2, 1\} = H$

$r^2H = \{r^2 \cdot 1, r^2 \cdot r, r^2 \cdot r^2\} = \{r^2, 1, r\} = H$

$sH = \{s \cdot 1, s \cdot r, s \cdot r^2\} = \{s, sr, sr^2\}$

$srH = \{sr \cdot 1, sr \cdot r, sr \cdot r^2\} = \{sr, sr^2, s\}$

$sr^2H = \{sr^2 \cdot 1, sr^2 \cdot r, sr^2 \cdot r^2\} = \{sr^2, s, sr\}$

There are two left cosets:

$\{1, r, r^2\} = H = rH = r^2H$

$\{s, sr, sr^2\} = sH = srH = sr^2H$

right cosets:

$$H1 = \{1 \cdot 1, r \cdot 1, r^2 \cdot 1\} = \{1, r, r^2\}$$

$$Hr = \{1 \cdot r, r \cdot r, r^2 \cdot r\} = \{r, r^2, 1\}$$

$$Hr^2 = \{1 \cdot r^2, r \cdot r^2, r^2 \cdot r^2\} = \{r^2, 1, r\}$$

$$Hs = \{1 \cdot s, r \cdot s, r^2 \cdot s\} = \{s, sr^2, sr\}$$

$$\begin{aligned} rs &= sr^{-1} = sr^{3-1} = sr^2 \\ r^2s &= sr^{-2} = sr^{3-2} = sr \end{aligned}$$

$$Hsr = \{1 \cdot sr, r \cdot sr, r^2 \cdot sr\} = \{sr, s, sr^2\}$$

$$\begin{aligned} rsr &= sr^{-1}r = s \\ r^2sr &= sr^{-2}r = sr^{-1} = sr^2 \end{aligned}$$

$$Hsr^2 = \{1 \cdot sr^2, r \cdot sr^2, r^2 \cdot sr^2\} = \{sr^2, sr, s\}$$

$$\begin{aligned} rsr^2 &= sr^{-1}r^2 = sr \\ r^2sr^2 &= sr^{-2}r^2 = s \end{aligned}$$

There are two right cosets:

$$\{1, r, r^2\} = H = Hr = Hr^2$$

$$\{s, sr, sr^2\} = Hs = Hsr = Hsr^2$$

In this case the left and right cosets are the same.

The group D_6 is partitioned by its left or its right cosets.

In this case in the same way.

The set of left cosets is

$$D_6/H = \{H, sH\}$$

Theorem: Let G be a group
and $H \leq G$. Let $a, b \in G$.

Then:

- ① $a \in aH$
- ② $aH = bH$ iff $b^{-1}a \in H$
- ③ $aH = bH$ iff $a \in bH$
- ④ $aH = bH$ iff $a = bh$ for some $h \in H$
- ⑤ The left cosets of G partition G .

That is, $G = \bigcup_{g \in G} gH$

and given any two left cosets
 aH and bH either $aH \cap bH = \emptyset$
or $aH = bH$.

- ⑥ If H is finite, then $|aH| = |H| = |Ha|$

Proof:

① $e \in H$ since $H \leq G$.

Thus, $a = ae \in aH$.

② ($\Rightarrow$) Suppose $aH = bH$

By part ① we know $a \in aH$.

Since $aH = bH$ this gives $a \in bH$.

Thus, $a = bh$ for some $h \in H$.

Thus, $b^{-1}a = h \in H$.

($\Leftarrow$) Suppose $b^{-1}a \in H$

Then $b^{-1}a = h$ for some $h \in H$.

Let's show $aH = bH$ by showing
both $aH \leq bH$ and $bH \leq aH$.

Let $z \in aH$.

Then $z = ah_1$ where $h_1 \in H$.

So, $z = ah_1 = bh_1 = b(\underbrace{hh_1}_{\substack{\text{in } H \\ \text{since } H \leq G}}) \in bH$

Thus, $aH \subseteq bH$.

Now suppose $w \in bH$.

Then $w = bh_2$ where $h_2 \in H$.

So, $w = bh_2 = ah^{-1}h_2 = a(\underbrace{h^{-1}h_2}_{\substack{\text{in } H \\ \text{since } H \leq G}}) \in aH$

Thus, $bH \subseteq aH$.

Therefore $aH = bH$.

③ HW

④ HW

⑤ Clearly $gH \subseteq G$ for any $g \in G$.

Thus,

$$G = \bigcup_{g \in G} \{g\} \subseteq \bigcup_{g \in G} gH \subseteq G.$$

$$\text{So, } G = \bigcup_{g \in G} gH.$$

Let aH and bH be two left cosets.

We want to show that either
 $aH = bH$ or $aH \cap bH = \emptyset$.

We do this by showing that
 $aH = bH$ iff $aH \cap bH \neq \emptyset$.

($\Rightarrow$) Suppose $aH = bH$.

Then, $aH \cap bH = \underline{aH} \neq \emptyset$
since $a \in aH$

($\Leftarrow$) Suppose $aH \cap bH \neq \emptyset$.

Then there exists $z \in aH \cap bH$.

Thus, $z = ah_1$ and $z = bh_2$ where

$h_1, h_2 \in H$.

Now let's show $aH = bH$.

Let $y \in aH$.

Then $y = ah_3$ where $h_3 \in H$.

Since $ah_1 = z = bh_2$ we have
that $a = bh_2h_1^{-1}$.

Thus, $y = ah_3 = \underbrace{bh_2h_1^{-1}h_3}_{\text{in } H} \in bH$

So, $aH \subseteq bH$.

Suppose $x \in bH$.

Then $x = bh_4$ where $h_4 \in H$.

Since $ah_1 = bh_2$ we have $b = ah_1h_2^{-1}$

Thus,
 $x = bh_4 = \underbrace{ah_1h_2^{-1}h_4}_{\text{in } H} \in aH$

So, $bH \subseteq aH$.

Hence $aH = bH$.

(6) HW

Ex: $\mathbb{Z}_6 = \{\bar{0}, \bar{1}, \bar{2}, \bar{3}, \bar{4}, \bar{5}\}$

$$H = \langle \bar{3} \rangle = \{\bar{0}, \bar{3}\}$$

$$\bar{0} + H = \{\bar{0}, \bar{3}\} = \bar{3} + H$$

$$\bar{1} + H = \{\bar{1}, \bar{4}\} = \bar{4} + H$$

$$\bar{2} + H = \{\bar{2}, \bar{5}\} = \bar{5} + H$$

$\bar{0} + H$	$\bar{1} + H$	$\bar{2} + H$	$\mathbb{Z}_6$
$\bar{0} \cdot$	$\bar{1} \cdot$	$\bar{2} \cdot$	
$\bar{3} \cdot$	$\bar{4} \cdot$	$\bar{5} \cdot$	

The set of left cosets is

$$\mathbb{Z}_6/H = \{\bar{0} + H, \bar{1} + H, \bar{2} + H\}$$

Lagrange's theorem

Let G be a finite group
and $H \leq G$.

Then, $|H|$ divides $|G|$.

proof:

Let $g_1H, g_2H, \dots, g_rH$ be the
distinct left cosets that partition G .

From the theorem,

$$|g_1H| = |g_2H| = \dots = |g_rH| = |H|$$

Thus,

$$|G| = |g_1H| + |g_2H| + \dots + |g_rH|$$

$$= |H| + |H| + \dots + |H|$$

$$= r|H|$$

Corollary: If G is a group and $|G| = p$ where p is prime, then G is cyclic.

proof: Since p is prime, $p \geq 2$.
Thus, there exists $x \in G$ where $\underbrace{x \neq e}$.

Consider $H = \langle x \rangle$.

Since $x \neq e$, we know $e, x \in H$ and that $|H| \geq 2$.

By Lagrange, $|H|$ divides $|G| = p$.
The only divisors of p are 1 and p because p is prime.

Thus, $|H| = p$.

Therefore $H = G$.

Thus, $G = \langle x \rangle$ is cyclic

Theorem: Let G be a finite group.
If $x \in G$, then the order of x
divides $|G|$.

Proof: Let $H = \langle x \rangle$.
Then, $H = \{e, x, x^2, \dots, x^{m-1}\}$ where
 m is the order of x .

So, $|H| = m$.

By Lagrange's theorem, $|H|$ divides $|G|$.
So, m divides $|G|$.

Def: Let G be a group and $H \leq G$.
We say that H is normal if
 $gH = Hg$ for all $g \in G$.

We write $H \trianglelefteq G$ to mean that H is
a normal subgroup of G .

Ex: $D_6 = \{1, r, r^2, s, sr, sr^2\}$

$$H = \langle r \rangle = \{1, r, r^2\}$$

previously we saw that:

left cosets

$$\{1, r, r^2\} = H = rH = r^2H$$

$$\{s, sr, sr^2\} = sH = srH = sr^2H$$

right cosets

$$\{1, r, r^2\} = H = Hr = Hr^2$$

$$\{s, sr, sr^2\} = Hs = Hsr = Hsr^2$$

Thus, $H \trianglelefteq D_6$

Ex: $D_6 = \{1, r, r^2, s, sr, sr^2\}$

$$H = \langle s \rangle = \{1, s\}$$

left cosets

$$H = \{1, s\} = sH$$

$$rH = \{r, rs\} = \{r, sr^{-1}\} = \{r, sr^2\} = sr^2H$$

$$r^2H = \{r^2, r^2s\} = \{r^2, sr\} = srH$$

So, the left cosets partition D_6 as follows:

1 •	r •	r ² •
s •	sr ² •	sr •

D_6

right cosets

$$H = \{1, s\} = Hs$$

$$Hr = \{r, sr\} = Hsr$$

$$Hr^2 = \{r^2, sr^2\} = Hsr^2$$

The right cosets partition D_6 as follows:

$1 \cdot$ $s \cdot$	$r \cdot$ $sr \cdot$	$r^2 \cdot$ $sr^2 \cdot$
------------------------	-------------------------	-----------------------------

 D_6

The left and right cosets are not the same. Thus, H is not a normal subgroup of D_6 .

Theorem: If G is an abelian group,
then all of its subgroups are normal.

proof: Let G be an abelian group.

Let $H \leq G$ and $g \in G$.

Then,

$$gH = \{gh \mid h \in H\} = \{hg \mid h \in H\} = Hg.$$

Thus, $H \trianglelefteq G$.

Ex: $\mathbb{Z}_6 = \{\bar{0}, \bar{1}, \bar{2}, \bar{3}, \bar{4}, \bar{5}\}$ is abelian.

All subgroups of $\mathbb{Z}_6$ are normal.

$$\langle \bar{0} \rangle = \{\bar{0}\}$$

$$\langle \bar{1} \rangle = \langle \bar{5} \rangle = \mathbb{Z}_6$$

$$\langle \bar{2} \rangle = \langle \bar{4} \rangle = \{\bar{0}, \bar{2}, \bar{4}\}$$

$$\langle \bar{3} \rangle = \{\bar{0}, \bar{3}\}$$

Theorem: Let G be a group and $H \leq G$.
Then the following are equivalent.

① H is normal.

② $gHg^{-1} \subseteq H$ for all $g \in G$

③ $gHg^{-1} = H$ for all $g \in G$

} Here
 $gHg^{-1} = \{ghg^{-1} \mid h \in H\}$

proof:

(① $\Rightarrow$ ②) Assume H is normal, that is $gH = Hg$ for all $g \in G$.

Fix some $g \in G$.

Let $x \in gHg^{-1}$.

Then $x = ghg^{-1}$ for some $h \in H$.

Since $gh \in gH$ and $gH = Hg$ there exists h_1 where $gh = h_1g$.

Then, $x = ghg^{-1} = h_1gg^{-1} = h_1 \in H$.

So, $gHg^{-1} \subseteq H$.

(② $\Rightarrow$ ③) Assume $xHx^{-1} \subseteq H$ for all $x \in G$.

We must show that $H \subseteq xHx^{-1}$ for all $x \in G$.

Let $g \in G$ be fixed.

Let's show $H \subseteq gHg^{-1}$.

Let $h \in H$.

Then, $g^{-1}hg = g^{-1}h(g^{-1})^{-1} \in H \leftarrow \boxed{\text{by assumption with } x = g^{-1}}$

Thus, $g^{-1}hg = h_2$ where $h_2 \in H$.

Then, $h = gh_2g^{-1} \in gHg^{-1}$.

Thus, $H \subseteq gHg^{-1}$.

(③ $\Rightarrow$ ①) Suppose $xHx^{-1} = H$ for all $x \in G$.

Let g be fixed.

Let $x \in gH$.

Then, $x = gh$ where $h \in H$.

By assumption $ghg^{-1} \in H$ and so $ghg^{-1} = h_3$ where $\underbrace{h_3 \in H}$
 $\leftarrow \boxed{\text{assumption with } x = g}$

Thus, $x = gh = h_3g \in Hg$.

So, $gH \subseteq Hg$.

Similarly let $y \in Hg$.

Then $y = h'g$ for some $h' \in H$.

And $g^{-1}h'g = g^{-1}h(g^{-1})^{-1} \in H \leftarrow \boxed{\text{assumption with } x = g^{-1}}$

So, $g^{-1}h'g = h_4$ for some $h_4 \in H$.

Then, $y = h'g = gh_4 \in gH$.

Thus, $Hg \subseteq gH$.

Therefore, $Hg = gH$ and H is normal. $\square$

Theorem: Let $\varphi: G_1 \rightarrow G_2$ be a homomorphism.
Then, $\ker(\varphi) \trianglelefteq G_1$.

Proof: We know $\ker(\varphi) \leq G_1$.
Let's show that $\ker(\varphi)$ is normal.
Let $g \in G_1$ and $h \in \ker(\varphi)$.

$$\begin{aligned} \text{Then, } \varphi(ghg^{-1}) &= \varphi(g)\varphi(h)\varphi(g^{-1}) \\ &= \varphi(g)e_2\varphi(g^{-1}) && \left\{ \begin{array}{l} \text{since} \\ h \in \ker(\varphi) \end{array} \right. \\ &= \varphi(g)\varphi(g^{-1}) \\ &= \varphi(gg^{-1}) \\ &= \varphi(e_1) \\ &= e_2 \end{aligned}$$

So, $ghg^{-1} \in \ker(\varphi)$.

Thus, $g(\ker(\varphi))g^{-1} \subseteq \ker(\varphi)$

So, $\ker(\varphi)$ is normal.

Ex: Consider $GL(2, \mathbb{R}) = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} \mid a, b, c, d \in \mathbb{R} \right\}$
 $ad - bc \neq 0$

Consider $\det: GL(2, \mathbb{R}) \rightarrow \mathbb{R}^*$.

We know $\det$ is a homomorphism since
 $\det(AB) = \det(A)\det(B)$.

The kernel is

$$\begin{aligned} \ker(\det) &= \left\{ A \in GL(2, \mathbb{R}) \mid \det(A) = 1 \right\} \\ &= SL(2, \mathbb{R}) \end{aligned}$$

Thus, $SL(2, \mathbb{R}) \trianglelefteq GL(2, \mathbb{R})$.

It turns out that if $H \trianglelefteq G$ then the set of left cosets can be made into a group using the operation $(aH)(bH) = (ab)H$. Since there can be multiple ways to represent a left coset we must make sure this operation is well-defined.

Theorem: Let G be a group and $H \leq G$. The operation $(aH)(bH) = (ab)H$ on the set of left cosets G/H is well-defined if and only if H is normal.

Proof:

($\Leftarrow$) Suppose H is a normal subgroup of G . Consider $a, b, c, d \in G$ where $aH = cH$ and $bH = dH$. We must show that $(aH)(bH) = (ab)H$ is equal to $(cH)(dH) = (cd)H$.

Since $aH = cH$ we know $a \in cH$ and so $a = ch_1$ where $h_1 \in H$.

Similarly since $bH = dH$ we have $b = dh_2$ where $h_2 \in H$.

Then, $ab = ch_1dh_2$.

Since H is normal we know $Hd = dH$.

Thus since $h_1 d \in Hd$ we know $h_1 d \in dH$.

Hence $h_1 d = dh_3$ for some $h_3 \in H$.

Thus, $ab = ch_1 dh_2 = cdh_3 h_2 \in cdH$.

Since $ab \in cdH$ we know $abH = cdH$.

($\Leftarrow$) [Skip this direction in class since not used.]

Suppose the operation on left cosets is well-defined, that is if $aH = cH$ and $bH = dH$, then $abH = cdH$.

Let's show that H is normal.

Let $g \in G$ and $h \in H$.

Then, since $hH = eH$ we have

$$\bar{g}'H = (eH)(\bar{g}'H) = (hH)(\bar{g}'H)$$

well-defined operation

$$= h\bar{g}'H$$

Thus, $\bar{g}'H = h\bar{g}'H$.

So, $hg^{-1} \in g^{-1}H$.

Thus, $hg^{-1} = g^{-1}h_1$ where $h_1 \in H$.

So, $ghg^{-1} = h_1 \in H$.

We have shown that $ghg^{-1} \in H$
for any $g \in G$ and $h \in H$.

Hence H is normal.

Theorem: Let G be a group
and $H \trianglelefteq G$.

Then, G/H is a group under
the operation

$$(aH)(bH) = (ab)H$$

The identity element is $eH = H$

The inverse of aH is $a^{-1}H$.

proof:

① Let $a, b \in G$. Then, $ab \in G$.

Thus, $(aH)(bH) = abH \in G/H$.

So, G/H is closed under the operation.

② Let $aH, bH, cH \in G/H$.

Then,

$$(aH)[(bH)(cH)] = [aH][bcH]$$

since
G is
associative

$$= a(bc)H$$

$$= (ab)cH$$

$$= [abH][cH]$$

$$= [(aH)(bH)](cH)$$

③ Given $aH \in G/H$ we have

$$(aH)(eH) = aeH = aH$$

$$(eH)(aH) = eaH = aH$$

④ Given $aH \in G/H$ we have

$$(aH)(\bar{a}'H) = (a\bar{a}')H = eH$$

$$(\bar{a}'H)(aH) = (\bar{a}'a)H = eH$$

Ex: $D_6 = \{1, r, r^2, s, sr, sr^2\}$

$$H = \langle r \rangle = \{1, r, r^2\}$$

Left cosets:

$$H = \{1, r, r^2\} = rH = r^2H$$

$$sH = \{s, sr, sr^2\} = srH = sr^2H$$

Previously we saw that $H \trianglelefteq D_6$.

So, $D_6/H = \{H, sH\}$ is a group with operation $(aH)(bH) = (ab)H$.

D_6/H	H	sH
H	H	sH
sH	sH	H

$H = 1H$ is the identity.

$$\begin{aligned} (H)(sH) &= 1 \cdot sH = sH \\ (sH)(sH) &= s^2H = 1H = H \\ (H)(H) &= (1H)(1H) = H \\ (sH)(H) &= (sH)(1H) = sH \end{aligned}$$

The powers of sH are:

$$sH$$

$$(sH)(sH) = s^2H = 1H = H$$

Thus, $D_6/H = \langle sH \rangle$ is cyclic.

Since $|D_6/H| = 2$ we know $D_6/H \cong \mathbb{Z}_2$.

Ex: $\mathbb{Z}_6 = \{\bar{0}, \bar{1}, \bar{2}, \bar{3}, \bar{4}, \bar{5}\}$ is abelian

$H = \langle \bar{3} \rangle = \{\bar{0}, \bar{3}\}$ is a normal subgroup

left cosets:

$$\bar{0} + H = \{\bar{0}, \bar{3}\} = \bar{3} + H$$

$$\bar{1} + H = \{\bar{1}, \bar{4}\} = \bar{4} + H$$

$$\bar{2} + H = \{\bar{2}, \bar{5}\} = \bar{5} + H$$

$$\mathbb{Z}_6/H = \{\bar{0} + H, \bar{1} + H, \bar{2} + H\}$$

this is a group
with operation

$$(\bar{a} + H) + (\bar{b} + H) = (\bar{a} + \bar{b}) + H$$

identity:
 $\bar{0} + H$

Here's the group table.

$\mathbb{Z}_6/H$	$\bar{0} + H$	$\bar{1} + H$	$\bar{2} + H$
$\bar{0} + H$	$\bar{0} + H$	$\bar{1} + H$	$\bar{2} + H$
$\bar{1} + H$	$\bar{1} + H$	$\bar{2} + H$	$\bar{0} + H$
$\bar{2} + H$	$\bar{2} + H$	$\bar{0} + H$	$\bar{1} + H$

some example calculations

$$\begin{aligned}(\bar{0} + H) + (\bar{2} + H) &= (\bar{0} + \bar{2}) + H = \bar{2} + H \\(\bar{1} + H) + (\bar{1} + H) &= (\bar{1} + \bar{1}) + H = \bar{2} + H \\(\bar{1} + H) + (\bar{2} + H) &= \bar{3} + H = \bar{0} + H \\(\bar{2} + H) + (\bar{2} + H) &= \bar{4} + H = \bar{1} + H\end{aligned}$$

Note that the "powers" of $\bar{1}+H$ are:

$$\bar{1}+H$$

$$(\bar{1}+H) + (\bar{1}+H) = \bar{2}+H$$

$$(\bar{1}+H) + (\bar{1}+H) + (\bar{1}+H) = \bar{3}+H = \bar{0}+H$$

Thus, $\mathbb{Z}_6/H = \langle \bar{1}+H \rangle$ is cyclic.

Since $|\mathbb{Z}_6/H| = 3$ we have $\mathbb{Z}_6/H \cong \mathbb{Z}_3$.

Ex: Consider

$$G = \mathbb{Z}_4 \times \mathbb{Z}_2 = \{(\bar{0}, \bar{0}), (\bar{0}, \bar{1}), (\bar{1}, \bar{0}), (\bar{1}, \bar{1}), (\bar{2}, \bar{0}), (\bar{2}, \bar{1}), (\bar{3}, \bar{0}), (\bar{3}, \bar{1})\}$$

$$H = \langle (\bar{2}, \bar{0}) \rangle = \{(\bar{2}, \bar{0}), (\bar{0}, \bar{0})\}.$$

G is abelian, thus $H \trianglelefteq G$.

The left cosets are

$$(\bar{0}, \bar{0}) + H = \{(\bar{0}, \bar{0}), (\bar{2}, \bar{0})\}$$

$$(\bar{1}, \bar{0}) + H = \{(\bar{1}, \bar{0}), (\bar{3}, \bar{0})\}$$

$$(\bar{0}, \bar{1}) + H = \{(\bar{0}, \bar{1}), (\bar{2}, \bar{1})\}$$

$$(\bar{1}, \bar{1}) + H = \{(\bar{1}, \bar{1}), (\bar{3}, \bar{1})\}$$

So,

$$\mathbb{Z}_4 \times \mathbb{Z}_2 / H = \{(\bar{0}, \bar{0}) + H, (\bar{1}, \bar{0}) + H, (\bar{0}, \bar{1}) + H, (\bar{1}, \bar{1}) + H\}$$

has order 4. With identity $(\bar{0}, \bar{0}) + H$.

Is $\mathbb{Z}_4 \times \mathbb{Z}_2 / H$ cyclic?

Let's check the orders.

$$(\bar{0}, \bar{0}) + H$$

order 1

$$(\bar{1}, \bar{0}) + H$$

$$[(\bar{1}, \bar{0}) + H] + [(\bar{1}, \bar{0}) + H] = (\bar{2}, \bar{0}) + H = (\bar{0}, \bar{0}) + H$$

order 2.

$$(\bar{0}, \bar{1}) + H$$
$$[(\bar{0}, \bar{1}) + H] + [(\bar{0}, \bar{1}) + H] = (\bar{0}, \bar{2}) + H = (\bar{0}, \bar{0}) + H$$

order 2.

$$(\bar{1}, \bar{1}) + H$$
$$[(\bar{1}, \bar{1}) + H] + [(\bar{1}, \bar{1}) + H] = (\bar{2}, \bar{2}) + H = (\bar{2}, \bar{0}) + H = (\bar{0}, \bar{0}) + H$$

order 2.

So, $\mathbb{Z}_4 \times \mathbb{Z}_2 / H$ is not cyclic.
It is abelian (by HW) since $\mathbb{Z}_4 \times \mathbb{Z}_2$ is abelian.
